

Teacher Guide

Lesson goal

Help learners understand AI beyond the chat box by comparing levels of structure, evidence, and human control.

Before-lesson checklist

- Python environment is ready.
- Demo launches locally with `python app.py`.
- One safe scenario is chosen in advance.
- School-safe rules are visible.
- A fallback screenshot set is available in case connectivity fails.

Quick preflight:

```
python -m compileall src tests
python app.py
```

Quick-reference classroom flow

Section	Suggested timing	Teacher move	Student outcome
1. Frame the goal	5 min	Explain "lowest safe level"	Learners know what to compare
2. Baseline run	10 min	Run Level 1 and question claims	Learners separate fluency from reliability
3. Add checks	10 min	Run Level 3	Learners see structured control
4. Add evidence/revision	10 min	Run Level 4 or 6	Learners see quality lift and limits
5. Orchestrate carefully	10 min	Run Level 8	Learners see gates and review burden
6. Reflect	5 min	Exit ticket	Learners justify level choice

Suggested classroom pacing

45-minute version

1. Context and rules (5)
2. Level 1 baseline (10)

3. Level 3 checks (10)
4. Level 4 or 6 (10)
5. Reflection (10)

90-minute version

1. Context and rules (10)
2. Levels 1 to 4 comparison (25)
3. Levels 6 and 8 comparison (25)
4. Group scenario design (20)
5. Debrief and action planning (10)

Facilitation tips

- Keep one scenario fixed across levels.
- Ask for evidence, not opinions, when comparing outputs.
- Avoid treating Level 8 as "best" by default.
- Keep reminding that AI support should not replace thinking.
- Use workflow detail replay to slow down and inspect process.

Common misconceptions and Q&A guidance

Misconception: "If it sounds confident, it is probably right."

Teacher response: confidence is style, not proof.

Misconception: "Better prompts solve everything."

Teacher response: some tasks need evidence, checks, and explicit review gates.

Misconception: "Higher level means better answer."

Teacher response: higher level means more workflow structure; usefulness depends on task risk.

Misconception: "If it merged, we can trust it completely."

Teacher response: merge status in Glytch still requires human judgement before real-world use.

Teacher gotchas

Gotcha	What it means	What to do
Learners jump to tool debate	Session focus drifts to vendor names	Bring it back to task, evidence, checks
Level 8 feels "too much"	Complexity may exceed task need	Use it as a lesson in overengineering

Learners treat trace as an instruction	They think they must answer trace text	Clarify trace is run history only
AI wording sounds polished	Learners over-trust style	Ask them to name concrete verification steps

Example teacher script

- "Today we are not testing which tool is coolest; we are testing which level is safest for this task."
- "We are looking for where checks happen, not just what answer appears."
- "If we cannot explain why we trust it, we should not use it yet."

Printable materials

Markdown sources are in docs/ and printable PDFs are in docs/printable/.

To regenerate printables:

```
pip install reportlab
python tools/pdf/generate_printables.py
python tools/pdf/generate_tech_i_can_glytch_book.py
```

For US Letter output:

```
python tools/pdf/generate_printables.py letter
```
