

First Lesson Walkthrough

Goal

Run one complete learning loop: prompt baseline -> added checks -> evidence-aware run -> orchestration comparison -> reflection.

By the end, learners should be able to explain:

- why a fluent answer is not automatically a trustworthy answer
- why evidence and review checkpoints matter
- why the lowest safe level is usually the best starting point

Session setup

- Launch the demo with `python app.py`
- Open `http://127.0.0.1:8000`
- Choose one safe scenario for the whole lesson

Suggested scenario:

Plan a one-week revision timetable for three subjects with realistic breaks.

What success looks like

- Learners can identify what changed at each level.
- Learners can point to at least one place where human review is still required.
- Learners can justify why a lower or higher level was appropriate for the task.

Comparison table

Stage	What you run	What learners should notice
Baseline	Level 1	Fast draft, hidden assumptions, weak traceability
Checked	Level 3	Better structure and check points
Grounded or revised	Level 4 or 6	Evidence links or visible improvement loop
Orchestrated	Level 8	Worker split, gates, and merge decision pressure

Step 1 - Run Level 1

Prompt learners with these questions:

- What is useful right away?
- What could be wrong?
- What would you check before using this?

Record notes in plain language.

Step 2 - Run Level 3

Keep the same scenario. Ask learners:

- What changed from Level 1?
- Which parts are now easier to verify?
- What is still risky?

Step 3 - Run Level 4 or Level 6

If you pick Level 4, focus on evidence grounding.

If you pick Level 6, focus on critique and revision quality.

Ask learners to locate one concrete improvement and one remaining risk.

Step 4 - Run Level 8

Use this step as a control and responsibility lesson, not a "higher is always better" lesson.

Inspect together:

- taskboard entries
- verifier result
- approval gate
- merge decision
- final status

Step 5 - Use workflow detail for debrief

Open workflow detail and replay the run.

Ask:

- Where did the process become safer?

- Where did complexity increase?
- Which step should always involve a person?

Exit ticket

Each learner completes:

The lowest safe level for this scenario was...
because...

And:

One check I would always do before using an AI output is...
